

GUIDED CITY TOUR, ST-URSANNE

MONT TERRI ROCK LABORATORY

The underground laboratory of Mount Terri is a research laboratory under the direction of swisstopo (federal office of topography). 22 research partners from 10 countries are studying the characteristics of argillaceous rocks on the basis of opalinus clay. Formations of this type are being studied for suitability for the construction of geological depots for nuclear waste. The underground laboratory is used for research only. It is strictly forbidden to store radioactive waste there, not even temporarily.

In addition, the laboratory is also open to other areas of research, such as carbon sequestration and underground heat storage.

GOOD TO KNOW

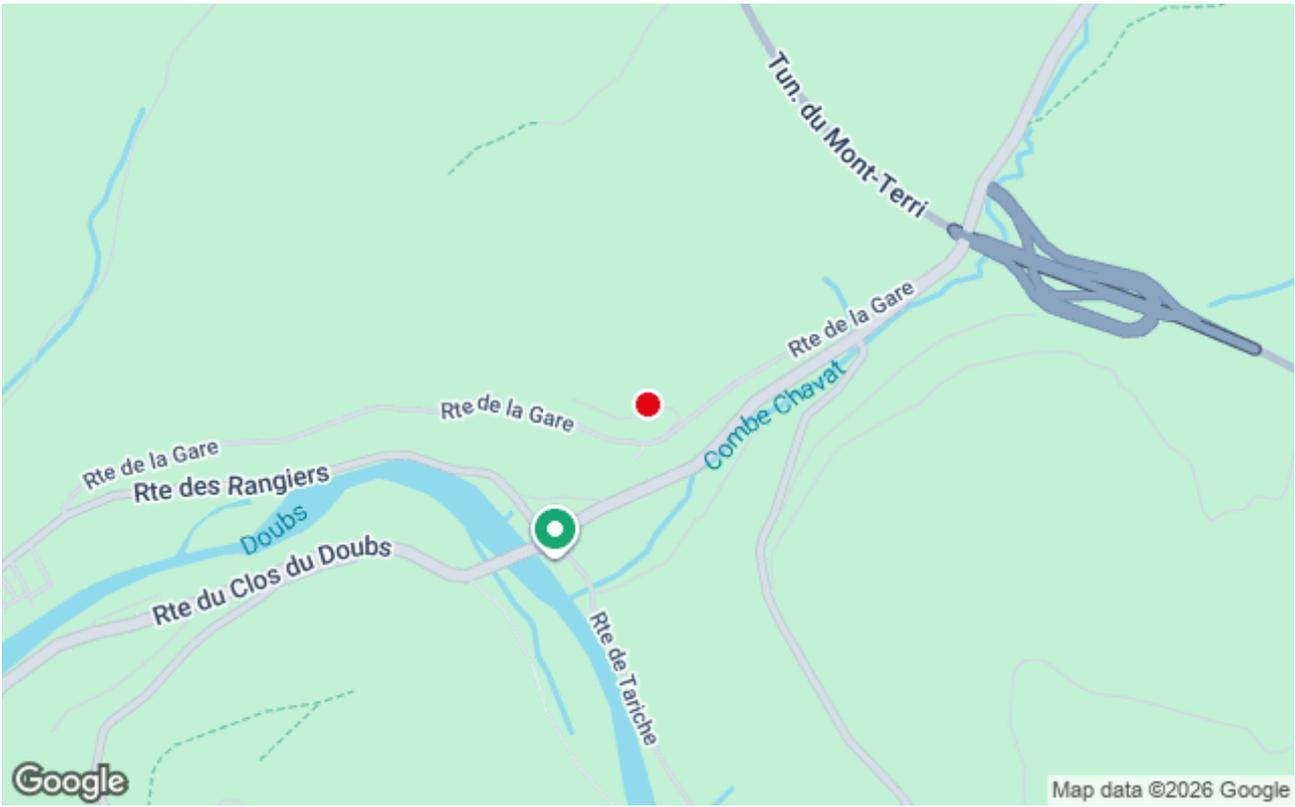

- Details of the visit: exhibition (10 min.), theoretical introduction (45 min.), minibus ride to the galleries (10 min.), visit of the laboratory (80 min.), return by minibus.
- Guided tour (on request)
- Duration: 2,5 hour
- Groups: max. 40 persons per group.
- Prices: Visits are free.
- Languages: French, German and English
- Bookings: all year round, except during the summer holidays (end of July and beginning of August) and during Christmas season.
